Ionizing Radiation Division⁴

National Institute of Standards and Technology
Gaithersburg, MD 20899

Database ELAST consists of cross sections for the elastic scattering of electrons and positrons by atoms. ELAST includes differential, total and transport cross sections, for scattering targets with atomic numbers Z from 1 to 100, at selected energies from 1 keV to 1024 keV. The cross sections were calculated with a computer code of Riley, based on the partial-wave expansion method. The electrons and positrons were assumed to be scattered by static, screened Coulomb potentials. Screening was calculated with the use of density distributions of atomic electrons obtained with a relativistic Dirac-Fock wave-function program of Desclaux. An interpolation program is included with which one can obtain elastic scattering cross sections at any energy between 1 keV and 1024 keV. Cross section tables for electrons are presented for 23 elements at 27 energies between 1 MeV and 1 keV.

*Work supported by the National Institute of Standards and Technology, Office of Standard Reference Data, and by the U.S. Department of Energy, Office of Health and Environmental Research.

¹Work carried out under Contract 50SBNB9C5555 with the National Institute of Standards and Technology.

²Guest Scientist. Permanent address: Dalian Institute of Chemical Physics, Chinese Academy of Sciences, Dalian, PR China.

³Summer student

1. Introduction

This report describes a database, called ELAST, which contains cross sections for the elastic scattering of electrons and positrons by atoms. The database was developed in order to provide improved input for transport calculations. The cross sections in ELAST have already been used in a calculation of electron back-scattering [1],⁵ in a comparison of the multiple scattering of electrons and positrons [2], and in a refinement of the Monte Carlo code ETRAN [3]. The ELAST and associated software, suitable for use on IBM-compatible personal computers, are distributed on two floppy disks, as described in the Appendix.

The cross sections were calculated by a relativistic partial-wave expansion method, using a computer code developed by Riley [4]. This code treats scattering by a static, screened Coulomb potential, and evaluates phase shifts through the numerical solution of the Dirac equation combined with use of the WKB approximation. The screened Coulomb potentials are obtained by solving the Poisson equation, using as input a density distribution of atomic electrons.

Riley, MacCallum, and Biggs [5] made extensive use of Riley's code, and published cross-section tables for electrons, for 24 elements, 33 deflection angles and nine energies (1, 2, 4, 8, 16, 32, 64, 128, and 256 keV). They estimated the accuracy of their results to be better than 1 percent, except for large-angle high-energy scattering from light elements where the uncertainties are several times larger. Their total and transport cross sections are stated to be accurate to three significant figures. These error estimates pertain only to the numerical evaluation, and do not include errors that may arise from the use of a static potential. Riley et al. [5], also presented 12-parameter fits to the cross sections at the above nine energies for all elements.

The use of a static potential implies neglect of the polarization of the target atom. Riley [4] estimated that for mercury atoms at 1 keV the inclusion of polarization effects would increase the elastic-scattering cross section by a factor 3.4 at 0 degrees, but by only 3 percent at 10 degrees. At higher energies the error due to the omission of polarization effects is much smaller and confined to extremely small deflection angles.

Database ELAST is an extension of the compilation of Riley, MacCallum and Biggs in the following respects: (a) the range of energies treated has been extended from 256 keV to 1024 keV; (b) the grid of angles, and the grid of energies below 8 keV was made finer; (c) cross sections are included not only for electrons but also for positrons; (d) ELAST is a computer-readable database, and software is provided for obtaining, by interpolation, cross sections at any energy between 1 keV and 1024 keV.

The calculations of Riley, MacCallum and Biggs involved the use of electron density distributions derived from non-relativistic Hartree-Fock wave functions of Mann [6] for atomic numbers Z between 1 and 35, and from

⁵Figures in brackets indicate literature references at the end of this paper.

relativistic wave functions of Mann and Waber [7] for higher atomic numbers. We used electron density distributions based on wave functions obtained with the relativistic multi-configuration code of Desclaux [8]. The use of electron-density distributions from [8] rather than from [6] and [7] results in cross section differences, which are smaller than the estimated uncertainties of the cross sections themselves.

In the version of Riley's code used in [5] and in the present work, exchange effects are neglected, even though an approximation for including them is discussed in [4]. The neglect of exchange effects is not expected to introduce significant errors in the energy region above 1 keV covered in the present database.

2. Illustrative Plots of Differential Cross Sections

This Section contains illustrative plots of the differential elastic scattering cross section as a function of the deflection angle. Figures 1a and 1b pertain to scattering of electrons by hydrogen, and figures 1c and 1d to scattering by uranium. For a hydrogen target there is a family of smooth curves at energies from 1024 keV to 1 keV. For uranium, however, there is a family of smooth curves only down to 8 keV, whereas at lower energies the cross sections exhibit an increasingly complex pattern characterized by resonances. The occurrence of these resonances is attributed to the existence of virtual bound states. Figures 2a, 2b, 2c and 2d illustrate the elastic scattering cross sections in the energy region 1 keV to 16 keV, for scattering by aluminum, copper, silver, and tungsten, respectively. For aluminum and copper, resonances are absent even down to 1 keV, but make an appearance for silver and tungsten at 1 keV or 2 keV.

The effects of screening on the elastic scattering cross sections are illustrated in figure 3a for carbon, and in figure 3b for tungsten. In these figures the results with screening were calculated with Riley's code, and those for a pure Coulomb potential from the theory of Mott [9].

The cross sections for the elastic scattering of positrons and electrons are compared in figures 4a, 4b and 4c for scattering by aluminum, silver, and gold. It can be seen that the cross sections for positron scattering are always smooth, even for high-Z targets down to 1 keV. The absence of resonances for positron scattering is due to the fact that virtual bound states do not occur with a repulsive potential.

3. Organization of the Database ELAST

ELAST contains differential as well as total and transport elastic scattering cross sections. The transport cross section (in atomic theory also referred to as momentum-transfer cross section) is

$$\sigma_{tr} = 2\pi \int_0^\pi \sigma_{el}(\theta) (1-\cos\theta) \sin\theta d\theta , \quad (1)$$

where θ is the scattering angle, and $\sigma_{el}(\theta)$ is the differential cross section per unit solid angle. The transport cross section is of interest because it is the single most important quantity governing the penetration and diffusion of electrons and positrons in bulk matter.

Database ELAST consists of three parts: ELAST1 and ELAST2 for electrons, and ELAST3, for positrons:

ELAST1: total and transport cross sections, and differential cross sections for electrons at 65 angles (see table 1), at 20 energies between 1 keV and 1024 keV, ($2^{n/4}$ keV, $n=0,1,\dots,12$, and 2^n keV, $n=4,5,\dots,10$).

ELAST2: total and transport cross sections, and differential cross sections for electrons at 193 angles (see table 2), at 13 energies between 1 keV and 8 keV, ($2^{n/4}$ keV, $n=0,1,\dots,12$).

ELAST3: total and transport cross sections, and differential cross sections for positrons at 65 angles (see table 1), at 11 energies between 1 keV and 1024 keV, (2^n keV, $n=0,1,\dots,10$).

Each of these three parts of the database consists of 100 files:

ELAST1.EXT
ELAST2.EXT EXT = 001, 002,.....,100.
ELAST3.EXT

The extension EXT represents the atomic number of the scattering material.

For convenience, the 100 data files in ELAST1 were compressed and stored in a self-extracting archive file ELAST1.EXE, the 100 files in ELAST2 in file ELAST2.EXE and the 100 files in ELAST3 in file ELAST3.EXE. The archive files can be decompressed, using an IBM-compatible PC, by the commands ELAST1, ELAST2 or ELAST3.

The program ELINT and the data files are stored on two 1.44 Mb disks:

Disk 1: ELAST1.EXE Compressed data file
ELAST3.EXE Compressed data file
ELINT.FOR Fortran source code for interpolation program ELINT
ELINT.EXE Executable code, for IBM-compatible PC

Disk 2: ELAST2.EXE Compressed data file

4. Contents of Individual Data Files

The files in the database are in ASCII format. The following Fortran code fragment indicates how these files can be read:

Code Fragment #1:

```
DO 30 J=1,JMAX
  READ (7,10) IZ,T(J)
10 FORMAT(I6,F12.5)
  READ (7,20) SIGTOT(J),SIGTRA(J)
  READ (7,20) (SIG(I,J),I=1,IMAX)
20 FORMAT(1P6E12.5)
30 CONTINUE
```

The variables have the following meaning:

JMAX:	number of energies,	20 for ELAST1, 13 for ELAST2, 11 for ELAST3;
IMAX:	number of angles,	65 for ELAST1, 193 for ELAST2, 65 for ELAST3;
IZ:	atomic number;	
T(J):	j'th energy, in keV;	
SIGTOT(J):	total cross section at energy T(J), in units of 10^{-16} cm ² ;	
SIGTRA(J):	transport cross section at energy T(J), in units of 10^{-16} cm ² ;	
SIG(I,J):	differential cross section per unit solid angle, at i'th angle and j'th energy, in units of 10^{-16} cm ² /sr.	

5. Interpolation

The calculation of elastic-scattering cross sections by the partial-wave expansion method requires a large computing effort, because many phase shifts (many hundreds, or even thousands at energies near 1 MeV) must be calculated. It would be rather impractical to carry out such lengthy calculations for the large number of energies for which cross sections are required for transport calculations. Fortunately it is possible to limit the partial-wave calculations to a moderate number of energies, and to obtain cross sections at other energies accurately by interpolation.

The following interpolation procedure was found to be satisfactory. For each deflection angle, the logarithm of the differential cross section was approximated by a cubic spline as a function of the logarithm of the particle energy. This spline function was then used for interpolation. A similar procedure was applied to the total and transport cross sections.

The results of such interpolations vs. energy are illustrated in figure 5 for the scattering of electrons by gold, at angles of 60, 90, 120 and 150 degrees. The curves were calculated by interpolation, whereas the

circles, squares, and triangles represent cross sections in the data base. It would appear that the cross sections in the database are spaced closely enough in energy to allow reliable interpolation.

In order to obtain benchmarks for checking the accuracy of the interpolation, additional elastic scattering cross section were calculated by the partial-wave-expansion method for the elements oxygen and gold, at energies other than those included in the database. Table 3 (for oxygen), and table 4 (for gold), show comparisons between interpolated and directly-computed cross sections at many energies and for many deflection angles. The interpolation errors generally amount to only a fraction of a percent, and are smaller than the estimated 1-percent uncertainties of the cross sections. The only exceptions to this occur at the small deflection angle of 0.5 degrees at an energy of 768 keV, where the error was found to be 2.6 percent in oxygen and 1.3 percent in gold.

6. Interpolation Code ELINT

The interpolation is done with a program called ELINT, which can be run for electrons (requiring the files ELAST1.EXT and/or ELAST2.EXT) or for positrons (requiring the files ELAST3.EXT). Listings of the Fortran source code for ELINT and the required subroutines can be found in the Appendix.

ELINT runs rather quickly on a personal computer (with a mathematical co-processor), but can of course be used also on other computer systems for which a Fortran 77 compiler is available. The energies to which the cross sections are to be interpolated can be supplied by an input file that provides the number of energies of interest, followed by a list of energies (in keV). Alternatively, a single energy can be entered by the user directly from the keyboard.

ELINT has five output options:

- 1) A table at 1 energy, for 65 deflection angles;
- 2) A table at 1 energy (below 8 keV), for 193 angles;
- 3) A table at many energies, for 65 angles. The user can choose the number of energies (not to exceed 9) for which cross sections will be printed on the same page.
- 4) A cross section array at one or many energies, for 65 angles;
- 5) A cross section array at 1 or many energies, all below 8 keV, for 193 angles.

Tables 5 and 6 show cross-section tables from sample runs of ELINT with output options 1 and 2 for electrons in tungsten at 100 keV and 5 keV. Tables 7 and 8 show results of sample runs with output option 1 for positrons in tungsten at 100 keV and 5 keV. The cross sections for electrons and positrons at 0 degrees should in principle be identical, whereas the electron-positron differences in the above table are 0.4 percent at 100 keV and 0.04 percent at 5 keV, well within the estimated uncertainties of the cross sections. Using ELINT, elastic-scattering cross sections were tabulated at 27 energies between 1 MeV and 1 keV for elements with 23 different atomic numbers. These results are presented in table 9.

Options 4) and 5) produce cross section arrays in a format convenient for use in other computer calculations. The following Fortran code fragment indicates how such arrays can be accessed:

Code Fragment #2:

```
READ (7,10) IZ,KPART,MENG,IMAX
10 FORMAT(4I6)
      DO 40 M=1,MENG
      READ (7,20) IMAX,ENG(M),SIGTOT(M),SIGTRA(M)
20 FORMAT(I6,0PF12.3,1P2E12.5)
      READ (7,30) (SIG(I,M),I=1,IMAX)
30 FORMAT(1P6E12.5)
40 CONTINUE
```

The variables have the following meaning:

IZ: atomic number
KPART: 1 for electrons, 2 for positrons
MENG: number of energies
IMAX: number of angles, 65 for ELAST1,
 193 for ELAST2,
 65 for ELAST3;
E(M): m'th energy, in keV;
SIGTOT(J): total cross section at energy E(M), in units of 10^{-16} cm²;
SIGTRA(M): transport cross section at energy E(M), in units of
 10^{-16} cm²;
SIG(I,M): differential cross section per unit solid angle, at i'th
angle and m'th energy, in units of 10^{-16} cm²/sr.

Figure Captions

Fig. 1. Elastic scattering cross sections for electrons, as function of the deflection angle.

- a. Hydrogen: 1, 2, 4, 8, and 16 keV
- b. Hydrogen: 32, 64, 128, 256, 512, and 1024 keV
- c. Uranium: 1, 2, 4, 8, and 16 keV
- d. Uranium: 32, 64, 128, 256, 512, and 1024 keV

Fig. 2. Elastic scattering cross sections for electrons, as functions of the deflection angle, at energies of 1, 2, 4, 8, and 16 keV.

- a. Aluminum
- b. Copper
- c. Silver
- d. Tungsten

Fig. 3. Ratio of the elastic scattering cross section for positrons to that for electrons, as a function of the deflection angle. The solid lines represent cross-section ratios obtained from ELAST, calculated for the case of a screened Coulomb field. The dashed curves represent the ratios which one obtains with the Mott cross section for an unscreened Coulomb field.

- a. Cross section ratios in carbon
- b. Cross section ratios in tungsten

Fig. 4. Comparison of the elastic scattering cross sections for electrons and positrons at 1 keV.

- a. Aluminum
- b. Silver
- c. Gold

Fig. 5. Elastic scattering cross section for electrons in gold, at various angles, as a function of the electron energy. The triangles, squares and circles represent cross sections in the database ELAST. The curves were obtained with the interpolation program ELINT.

Appendix: Source Code for Program ELINT

ELINT calls for three subroutines. Subroutine SCOFD generates coefficients for cubic-spline interpolation. Subroutine BSPOLD carries out the interpolation with these coefficients. Subroutine INDEX converts a integer with no more than three digits to three-character variable which is used as an extension for a file name. For an example, if the file ELAST1.013 for aluminum is required, the user specifies the atomic number, 13, as an integer, and ELINT generates the file name ELINT1.013 by concatenating the root name ELINT1 with the extension 013 produced by INDEX.

Appendix

```

PROGRAM ELINT
C 15 Jan 92. Written by H.J.Berger, NIST, Gaithersburg, MD 20899.
C By interpolation, calculates elastic scattering cross sections
C at a specified set of energies (keV).
C Calls subroutines SCOFD, BSPOLD and INDEX.
